

CABIN AIR FILTERS

JUST BECAUSE AIR IS COMING OUT OF YOUR AIR
CONDITIONING VENTS, DOESN'T MEAN IT'S CLEAN!

**An inexpensive way to breathe
easier and cleaner!**

Cabin air filters are designed to remove contaminants such as pet dander, dust, soot and exhaust fumes from the air we breathe inside our cab. A dirty cabin air filter can reduce airflow, decreasing the efficiency of the HVAC system and put unnecessary strain on the blower motor. Don't assume that because air is coming out of your vents that it's clean. Your A/C is designed to heat and cool the air, not clean it. Increase your air quality by making sure your cabin air filter is replaced every 12 months or 12,000 miles.

Not sure if your vehicle has a cabin air filter? Consult your owners manual or contact your service dealer.
