

TECH TIP

CABIN AIR FILTERS

When the customer complaint is lack of airflow from the vents, the cure can be as simple as changing the cabin air filter. Many trucks now use a cabin air filter to clean the air entering the passenger compartment. Depending on location, the cabin filter will filter outside air only or be positioned to filter both outside and recirculated air. Other applications may have one cabin air filter for fresh air and a separate cabin air filter for recirculated air. And just like other filters, the cabin air filter can become clogged with dirt and restrict airflow. Check vehicle manufacturer specifications for maintenance service intervals.

Note: If the vehicle does not have a cabin air filter, refer to TT329 Insufficient Airflow from Dash.
